Looking Away

Building 1: Moves

Arrows from a floor to itself, and what counting their "hows gives.

A *move* is an arrow from a floor to itself that is an inside and a picture (Chapter 0, W2). Forgetting *how* one thing moves to another gives a blur: Building 0. This book keeps the how. It reads Building 0 and is never read by it (the rule F7, between buildings).

Planned, not yet written (`plans/ALGEBRA-PATH.md`). Part I: Rearrangements; Words. Part II: Groups, the table; Cosets and Lagrange; Normal subgroups; Chapters 2, 7, 14 again over any ring; Modules and the Smith form; Actions; Counting and Sylow; Divisibility in any ring; Linear maps; Similarity; Forms; Field extensions; Finite fields; the Galois correspondence; Solvable ladders and radicals. Then the elliptic curves: the projective plane; plane curves; the group law as a blur; over $\mathbb{Z}/p$; the torus.
